"Sugar-uncleotide denor specificity of histo-blood group A and B
"Sugar-uncleotide denor specificity of histo-blood group A and B
"Lansferases is based on amino acid substitutions.";

"Biol. Chem. 265:19257-19262(1990).

"I show the histo-blood group ABO involves three carbohydrate antigens: A, B, and H. A, B, and AB individuals express a glycosyltransferase activity that converts the H antigen to the A antigen (by addition of UDP-GalMac) or to the B antigen (by addition of UDP-GalMac) or to the B antigen (by addition of UDP-GalMac) or to the B antigen (by addition of UDP-Gal).

"CATALYTIC ACTIVITY: UD-N-acetyl. D-galactosamine + glycoprotein-alpha-D-galactosaminyl-(1,3)-[alpha-L-fucosyl-(1,2)]-D-galactose.

"CATALYTIC ACTIVITY: UDP-galactose + alpha-L-fucosyl-(1,2)-D-galactose.

"CATALYTIC ACTIVITY: UDP-galactose + alpha-L-fucosyl-(1,2)-D-galactose.

"CATALYTIC ACTIVITY: UDP-galactose + alpha-L-fucosyl-(1,2)-D-galactose.

"CATALYTOR TOTYTY: UDP-galactose + alpha-L-fucosyl-(1,2)-D-galactose.

C-X-C chemokine receptor type 5 (CXC-R5) (CXCR-5) (Burkitt'S lymphoma receptor 1) (Monocyte-derived receptor 15) (MDR15).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PENCYLONG. 187:655-660(1998).

-!- FUNCTION: CYTOKINE RECEPTOR THAT BINDS TO BLC. BIRI EXERTS POSSIBLY A REGULDATORY FUNCTION IN BURKITT LYMPHOMA (BL) LYMPHOMAGENESIS AND/OR B-CELL DIFFERENTIATION. IT IS A POTENTIAL CANDIDATE FOR CELL-CELL INTERACTION, AND ACTIVATION OF MATURE B-LYMPHOCYTES IN LYMPHOTIC TISSUES.

-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- ALTERNATIVE PRODUCTS:

EVENT.=Alternative splicing; Named isoforms=2;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Legler D.F., Loetscher M., Stuber Roos R., Clark-Lewis I., Baggiolini M., Moser B., "Be cell-attracting chemokine I, a human CXC chemokine expressed in lymphoid tissues, selectively attracts B lymphocytes via
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TISSUE=Lymphocytes;

The invention relates to compounds comprising an immunogenic ligand whose sequence is based in part on residues 42-50 of human cancer antigen ATF4(TERB-2 (Inct defined) and the polynucleotides encoding them. Also included are an antibody that specifically recognises and binds the compound, a method for inducing an immune response in a subject by delivering the compound, a method of immunotherapy comprising deministering to a subject the antibody, an immune effector cell that has been raised in vitro or in vivo in the presence and at the expense of an intigor presenting cell that presents the immunogenic compound in the context of an MHC (major histocompatibility complex) molecule and a method of adoptive immunotherapy comprising administering the immune response to the synthetic and naturally occurring compounds. The compounds are useful for modulating an immune response to the synthetic and naturally occurring compounds. The compounds are useful for generating antibodies for compounds are useful for generating antibodies continued are also useful for generating antibodies that specifically recognise and bind to these molecules. These compounds are useful for immunotherapy when administered to a subject. The peptides, polypeptides and polynucleotides are useful in diagnostic methods, for the detection and purification of antibodies. The sequence represents a human cancer antigen ATP4/CRBB-2 based immunogenic contraction of the invention invention and purification of antibodies. The present invention in an alman cancer antigen ATP4/CRBB-2 based immunogenic contraction of the invention in an antipodies. The present antigen and purification of antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The invention relates to compounds comprising an immunogenic ligand whose sequence is based in part on residues 42-50 of human cancer antigen ATF4(TREB-2 (Inct defined) and the polymucleotides encoding them. Also included are an antibody that specifically recognises and binds the compound, a method of immunotherapy comprising the delivering the compound, a method of immunotherapy comprising been raised in vitro or in vivo in the presence and at the expense of an antigen presenting cell that presents the immunogenic compound in the context of an MHC (major histocompatibility complex) molecule and a method of adoptive immunotherapy comprising administering the immune response context of an MHC (major histocompatibility complex) molecule and a method of adoptive immunotherapy comprising administering the immune response to the synthetic and naturally occurring compounds. The compounds are useful for modulating an immune response to the synthetic and naturally occurring compounds. The compounds are useful for treating cancer, particularly ovarines. The compounds are also useful for generating antibodies that specifically recognise and bind to these molecules. These antibodies are large are also useful for generating antibodies con as immunogens for the detection and purification of antibodies, or as immunogens for the production of antibodies. The persent and purpaid and purpaid antibodies. The present immunoter represents a human cancer antigen ATF4(RRB-2 based immunogenic

                                                                                                                                                                                                                                                                                                     AAW56104
                                                                                                                                                                                                                                                                                                                               à
                                                                                                                                                                                                                                                  음
                                                                                                                                                                  The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (FCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in alectronic format directly from WIPO at ftp. wipo.int/pub/published_pct_sequences.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                      0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            detection reagent for detecting 1000 or more for elucidating cell signalling and cell-cell

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher wetkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                        New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The phenol oxidase may be used as a novel labelling oxidase. The elucidation of the primary structure of the prophenol oxidase will contribute to the reconstitution of a prophenol oxidase activation system which can be applied to the detection of microorganisms by measurement of beta-1,3-glucan and peptide glycan.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acids encoding 4277 human colon cancer-associated polypeptides, useful for preventing, diagnosing and/or treating colorectal cancers -

therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing c inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated PS, by inserting the nucleic acids into a host cell and culturing the cell compares the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB37789 represent sequences used in the exemplification of the present invention.

N.B. Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027 to 1052, 7921 and 7922.

which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; sequences have activities such as: cytostatic; hepatotropic; vulnerary; antiparkinsonian; nootropic; neuroprotective; cartiparkinsonian; nootropic; immunosuppressant; cimmunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antichart; antiparkinal immunosuppressant; cimmunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; cartifilammatory; antibacterial; antiviral; antifungal; antirheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating cut perbological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy. Vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, cycliferative disorders, cardiavascular disease, diabetes mellitus, chopsthyroidism, cholesterol ester storage, systemic lupus cythematosus, severe combined immunodeficiency (SCID), AIDS, viral, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, cocurnal haemoglobinuria, antiinflammatory disease; to enhance constrund the construction; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; ORF; open reading frame; ORFX; drug screening; diagnosis; disease monitoring; cytokine; cell proliferation; cell differentiation; dimune modulation; haematopoiesis regulation; tissue growth; angiogenesis; activin; inhibin; chemotactic; chemokinetic; haemostatic; thrombolytic; tumour inhibition; bodily characteristic; fertility; behaviour; cancer; proliferative disorder; neurological disorder; cardiovascular disease; immune system disorder; organ transplantation; tissue growth disorder; tissue regeneration disorder; diabetes mellitus; hypothyroidism; cholesterol ester storage disease; infection; vulnerary; vasotropic; antipsoriatic; antidiabetic; cytostatic; nootropic; orandiatherosclerotic; anticoagulant; thrombolytic; cardiant; hypotensive; antistherosclerotic; antidiamatory; immunomodulator; dermatological; analgesic; virucide; antibacterial; fungicide.

```
The invention relates to recombinant membrane targeting and translocation proteins from Escherichia coli. The recombinant pathway for transporting polypeptides are involved in the Sec-independent pathway for transporting proteins with a twin- arginine signal peptide to the periplasm or extracellular medium and to the cell membrane. They transport fully catracellular medium and to the cell membrane. They transport fully colded and co-factor containing proteins. The polypeptides are used to transport such proteins, specifically to produce soluble forms of polypeptides that are normally produced in insoluble form. They may also be used to raise specific antibodies. Nucleic acid sequences that encode the polypeptides are used for production of recombinant proteins and their fragments are used as probes to detect or isolate related genomic or cDNA sequences (these have been found in many other bacteria, yeast, plants, nematodes and humans). Producing normally insoluble proteins in denaturants and facilitates recovery of functional proteins (which have been properly folded by cytoplasmic enzymes before translocation).

Sequences AAV41214-41223 represent proteins homologous to the E. coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New recombinant membrane targeting and translocation proteins from Escherichia coli, used to produce soluble polypeptides normally produced in insoluble form
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example 6; Fig 8; 111pp; English.

ABM79587 represent cDNAs encoding them. The invention also encompasses
C ABM79587 represent cDNAs encoding them. The invention also encompasses
polyapeptides at least 80% identical to the ORF1-ORF434 (collectively
referred to as ORFX) proteins, polymucleotides at least 85% identical to
creferred to as ORFX proteins, methods and host cells comprising ORFX
polyupeptides, methods of screening for modulators of ORFX proteins antibodies
CC specific for ORFX proteins, methods of derecting ORFX proteins and methods of screening individuals for a predisposition or
activity, and methods of screening individuals for a predisposition or
activity, and methods of screening individuals for a predisposition or
activity, and methods of acreening individuals for a predisposition or
compared a disorder. The ORFX proteins of the invention have a wide
creaptor/ligand, antibities, such as cytokine, cell proliferation,
call differentiation, immune modulation, haematopoiesis regulation,
cell differentiation, antibities, such as cytokine, cell proliferation,
conflexible growth, anglogenesis, activin or inhibin activity, chemotactic/
chemokinheit activity, and may also be involved in the determination
conflexible and antibodies may be used in the treatment of cancers,
conclete acids and antibodies may be used in the treatment of cancers,
conterporiferative disorders such as spoilapsy and Alzheimer's disease,
conterpolated disorders such as goliapsy and Alzheimer's disease,
conterpolated disorders such as goliapsy and Alzheimer's disease,
content proliferative and probes, in the detection of ORFX genomic sequences,
contents and infectious diseases caused by viral, bacterial
contents and and antipolate mell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    18-JUN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  21-JUN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               22 - JUN
  The invention relates to isolated polymucleotide (I) and polymerase chain reaction (FRR) primers, oligomers, and for chromosome polymerase chain reaction (FRR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The conditions are also used in diagnostics as expressed sequence tags polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques for restore normal activity of (II) or treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) and of II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in companies for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of data and products dependent on DNA and and anno acid sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity -

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A, Description: The sequence of C. elegans cosmid C48B6.
A, Reference number: Z20544
A, Reference number: Z20544
A, Accession: T28923
A, Status: preliminary; translated from GB/EMBL/DDBJ
A, Molecule type: DNA
A, Residues: 1-1663 < MIN>
A, CROSS references: EMBL:U97189; PIDN: AAC48166.1; GSPDB:GN00019; CESP:C48B6.6
